1 Executive Summary

Cubo Consulting Pty Ltd has been engaged by Morpeth Gardens Pty Ltd to undertake a preliminary Stormwater Management Plan (WCMP) to support to DA for the proposed Country Club development at 39 Metford Rd, Tenambit.

The report concludes that:

1. There will be no increase in peak flowrates from the development site in storm events.
2. The existing OSD and Stormwater quality devices constructed downstream as part of an earlier stage of the development were designed to be adequate for the increase in runoff, with modifications required to the existing arrangement to suit the original Cubo design configuration, with the control pit to include twin 450mm diameter orifices, a 300mm diameter connection to the bioretention basin, and installation of an appropriate grated cover.
3. Two 5,000L rainwater tanks will collect runoff for reuse on site.

Yours Faithfully,

Prepared by

Doug Black

Design Engineer

Reviewed by

Vince Cubis

Director

2 Background Information

This document presents the Stormwater Management Plan for submission to the Maitland City Council (MCC) to support the DA for the proposed development at 39 Metford Rd, Tenambit.

A previous design using MOES was undertaken by this office in 2018. The design has been modelled with rainfall data stipulated in Appendix C of Maitland City Council Manual of Engineering Standards (MOES) 2014.

3 Site Context

The proposed development site is part of the Morpeth Gardens residential development. It currently contains a house with extensive lawns, and slopes away from Metford Road at approximately 5%. The total area of the site is approximately 4225m².

Roofwater from the house is discharged by 2x 100mm PVC pipes to a swale from the southern corner of the block to the upstream bypass pit.

Aerial photography of the existing site is presented in Figure 1-1 below.

The new development contributes to catchment A only and this part of the site discharge has been considered in this report. Refer to catchment map in 6.4.2.

Figure 1-1 Existing Site (Source - Sixmaps)

4 Proposed Development

The proposed development consists of a new clubhouse with swimming pool and additional carparking. The stormwater drainage will be connected to the existing system constructed in an earlier stage of the project and discharge to the downstream OSD basin.

Details of the development are contained within the construction drawings.

5 Stormwater Management Objectives

The objectives of this water cycle management plan include to provide:

- 1) An underground “minor system” of pipes that eliminates inconvenience to traffic and pedestrians.
- 2) An overland “major system” that conveys stormwater flows within suitable velocity/depth limits generally located within public land, or where approved or unavoidable, within private land covered by an easement.
- 3) Detention of stormwater flows that mimics natural, pre-developed flows for all storm events up to and including the 100-year ARI event.
- 4) Retention of stormwater flows to achieve water target quality standards.
- 5) Consideration of upstream and downstream catchments in their ultimate developed state to achieve a total system which does not adversely affect existing systems or properties within the flow path and catchment.
- 6) Employment of principles of Water Sensitive Urban Design and Stormwater Reuse.

6 Stormwater Management

6.1 Stormwater Quality Target

Chapter 6, Section 8.2 of MCC Engineering standards requires, as a minimum, the following reductions in total pollutant load, compared to untreated runoff from the developed site.

Table 1-1 Minimum pollutant reduction targets

Pollutant	Minimum Reduction
Total Suspended Solids (TSS)	80%
Total Phosphorus (TP)	45%
Total Nitrogen (TN)	45%
Gross Pollutants	70%

6.2 Stormwater Quality

The proposed development will include 2x 5,000L below ground rainwater tanks, collecting roof runoff for reuse on site. Rainwater tanks are generally considered to contribute to improvements in rainwater runoff quality.

The entirety of the site will discharge to the adjacent stormwater drainage network in the previous stage of the development, with all runoff captured and treated by the downstream treatment and detention arrangement.

6.3 MUSIC Water Quality Model

Both previous reports for this development (see references) demonstrated with a MUSIC model that the existing treatment train is adequate for the entirety of the development.

6.4 DRAINS On-Site Detention Model

Section 6.8.1 of MCC Engineering Standards requires on-site detention to ensure that post developed flows from a development site do not exceed pre-development flows for 1YR ARI, 10YR ARI, and 100YR ARI storm events.

A DRAINS computer model (Version 2023.11.8718.30178) using an ILSAX hydrological model was developed for the specific site area to demonstrate compliance with section 6.8.1 of MCC engineering standards.

6.4.1 Base Information

The DRAINS computer model was prepared in accordance with the requirements of Maitland City Council's current Manual of Engineering Standards (MoES) with rainfall data as stipulated in MoES.

6.4.2 Catchments

The current site was modelled as a single catchment with a total area of 4224m², 20% impervious, and an assumed critical duration of 5 minutes.

The proposed development was modelled as four separate catchments, the clubhouse roof, pool area, the carpark, and landscaping, totalling 4224m², averaging 64% impervious. The catchments have been modelled as discharging into the existing drainage network constructed in the previous stage.

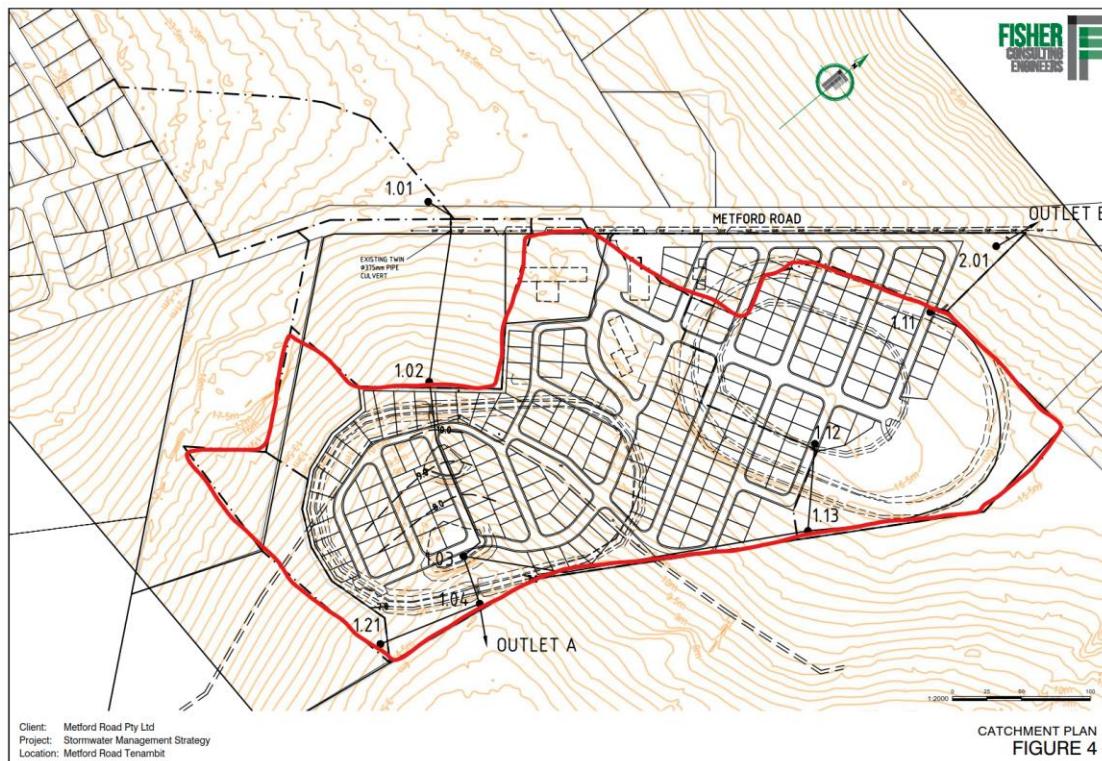

Figure 6-1 "Catchment A" (red) (Fisher 2016)

6.4.3 Results

The table below shows the total peak flows rates from the site as measured at the connection to the existing drainage.

Table 1-2 Summary of DRAINS peak outflows

Storm Event	Predeveloped Flows (L/s)	Developed Flows (L/s)	Comments
1YR ARI	67	53	Developed flows less than predeveloped flows
10YR ARI	142	73	Developed flows less than predeveloped flows
100YR ARI	217	145	Developed flows less than predeveloped flows

Post development flows are less than current flows for all required events.

There are negligible overland flows from the site in 10Yr ARI event.

6.4.4 Private Rainwater Tanks

The proposed development will include 2x 5,000L below ground rainwater tanks, collecting runoff from the roof for reuse on site. These was assumed to be full and so excluded from the model.

6.4.5 OSD Outflow

The downstream OSD was modelled based on our 2019 design and was not noticeably impacted by the additional flows from the proposed development.

6.5 Local Overland Drainage

The site currently sits below Metford Rd but will be separated by an extension of the existing kerb and footway, ensuring on road flows are directed downstream.

6.6 Flood Levels

Based on the MCC Flood Mapping, the subject site was found to be outside the flood extent for all events up to PMF.

7 Conclusion

Based on the available information and modelling, the proposed development:

- Will not require additional OSD.
- 4. Will not result in an increase in stormwater flow rates downstream, with modifications required to the existing arrangement to suit the original Cubo design configuration, with the control pit to include twin 450mm diameter orifices, a 300mm diameter connection to the bioretention basin, and installation of an appropriate grated cover.
- The existing treatment train has sufficient capacity to keep stormwater quality within the required parameters.

The construction of the existing OSD should be completed with the designed orifices provided on the control pit, formalised and concreted overflow weir, and appropriately sized rock mattress scour protection.

The existing pipe network between the proposed development and OSD basin should be verified as part of the approval process, and a WAE survey of the constructed stormwater drainage network and infrastructure prepared at the completion of works.

Run Log for 18011 v17 clubhouse and stage 2 observed osd
 \color{tbl}{\red0\green0\blue0}\red192\green0\blue0; Run Log for 18011 v17 clubhouse and stage 2 observed osd.drn - DRAINS run at 21:02:23 on 18/4/2024 using Watercom Drains v2023.11.8718.30178

Upwelling occurred at: P Club Roof etc, Pit 5.4, Pit 5.3, Pit 10-4

Freeboard was less than 0.15m at Pit74671, Pit71286, Pit Club Carpark, Pit 8.1, Pit 11.3, Pit 10-3

Peak water levels spilled in these Overflow Routes: OF38566, OF28109, OF14828, Of 1-9 Basin, OF 5.4 - 5.3, OF 10-4 1-9, OF 10-3 10-4, OF 9-2 10-4, OF 8-2 1-9, OF 5.5 - 5.4, OF 6-3 1-8 spilled. You cannot rely on these results. You really MUST specify data for higher levels for these cross sections.

Unless the cross section is not capable of conveying the modelled flow, a downstream node tailwater condition might exceed the incoming overflow route specified cross-sectional depth, such as an overflow route leading into the invert of a detention basin. You can view the water surface profile along an overflow route by right click > Long Section.

Tip: Keep in mind that an overflow route adds storage to any downstream node if the water is backing up into the overflow route (e.g. from a detention basin node). You may need to shorten & lift the downstream invert of the overflow route to a level above the calculated downstream water level to avoid double counting storage volumes.\cf1

These sag pits have unsafe water levels for minor storms: Pit74671, Pit71286, P Club Roof etc, Pit Club Carpark, Pit25991, Pit 5.3

Tip: Keep in mind that an overflow route adds storage to any downstream node if the water is backing up into the overflow route (e.g. from a detention basin node). You may need to shorten & lift the downstream invert of the overflow route to a level above the calculated downstream water level to avoid double counting storage volumes.\cf1

These sag pits have unsafe water levels for minor storms: Pit74671, Pit71286, P Club Roof etc, Pit Club Carpark

[colorblind]\red{vgreen\blue{[blue0;\red192\green0\blue0;\red0\green0\blue0]}} Run Log for 18011 v17 clubhouse and stage 2 observed osd.rsn - DRAINS run at 21:03:26 on 18/4/2024 using Watercom Drains v2023.11.8718.30178

The maximum water level in these storages exceeds the maximum elevation you specified: Basin.
DRAINS has extrapolated the Elevation vs Storage table to a higher Elevation. Please provide accurate values for higher elevations.

Upwelling occurred at: Pit74671, P Club Roof etc, Pit 5.4, Pit 5.3, Pit 10-4, Pit 10-3

Freeboard was less than 0.15m at Pit71286, Pit Club Carpark, Pit25991, Pit 8-2, Pit 9-2, Pit 8.1, Pit 11.3, Pit 8-1

The maximum pond depth in these sag pits is unsafe: Pit74671, Pit71286, P Club Roof etc, Pit25991, Pit 5.3\line

The maximum pond depth in these *sug_pro* is 0.0343, F110-402, F110-1200, Club River, F123559, 11.35' (ft).

Unless the cross section is not capable of conveying the modelled flow, a downstream node tailwater condition might exceed the incoming overflow route specified cross-sectional depth, such as an overflow route leading into the invert of a detention basin. You can view the water surface profile along an overflow route by right click > Long Section.

Tip: Keep in mind that an overflow route adds storage to any downstream node if the water is backing up into the overflow route (e.g. from a detention basin node). You may need to shorten & lift the downstream invert of the overflow route to a level above the calculated downstream water level to avoid double counting storage volumes.\cf1
